

determine that the biometric data indicates, at least in part, a second contextual or environmental state different from the first contextual or environmental state; and modify the sequential display order of the data display pages based on the determination that the biometric data indicates the second contextual or environmental state to produce a second sequential display order, wherein the first sequential display order and the second sequential display order are different.

[0322] Implementation 37. The apparatus of implementation 28, wherein the memory further stores computer-executable instructions for controlling the at least one processor to modify the sequential display order of the data display pages by adding or removing a data display page from the plurality of data display pages based on the determination that the biometric data indicates the first contextual or environmental state.

[0323] Implementation 38. The apparatus of implementation 28, wherein the memory further stores computer-executable instructions for controlling the at least one processor to determine that the first contextual or environmental state is associated with a first user-specified sequential display order; and modify the sequential display order of the data display pages to correspond to the first user-specified sequential display order to produce the first sequential display order.

[0324] Implementation 39. The apparatus of implementation 38, further including a communications interface, wherein the memory, the at least one processor, the one or more biometric sensors, the page advance input, the display, and the communications interface are communicatively connected with one another, and the memory and/or at least one processor are configured to receive data indicating the user-specific sequential display order via the communications interface and from a device external to the apparatus.

[0325] Implementation 40. The apparatus of implementation 28, wherein the memory further stores computer-executable instructions for controlling the at least one processor to determine that at least one of the data display pages in the plurality of data display pages has a user-specified priority; and modify the sequential display order of the data display pages based on the determination that the biometric data indicates the first contextual or environmental state and the user-specified priority of the at least one data display page to produce a first sequential display order.

[0326] Implementation 41. The apparatus of implementation 28, wherein the memory further stores computer-executable instructions for controlling the at least one processor to determine that the display is turned off when a page advance request is received; determine the data display page displayed on the display when the display was turned off; cause the display to turn on responsive to the page advance request; and modify the sequential display order such that the data display page that was displayed on the display when the display was turned off is displayed on the display after the display is turned on again and responsive to the page advance request.

[0327] Implementation 42. The apparatus of implementation 28, wherein the memory further stores computer-executable instructions for controlling the at least one processor to: determine that the display is turned off when a page advance request is received; determine the data display page displayed on the display when the display was turned off; cause the display to turn on again; modify the sequential display order such that at least one interim data display page different from the data display page that was displayed on the display when the display was turned off is the first data display page or

pages displayed on the display after the display is turned on again and responsive to the page advance request; and modify the sequential display order such that the data display page that was displayed on the display when the display was turned off is the next data display page that is displayed on the display after the at least one interim data display page is displayed.

[0328] Implementation 43. The apparatus of implementation 42, wherein the at least one interim data display page includes a data display page showing a time-of-day clock.

[0329] Implementation 44. The apparatus of implementation 42, wherein the at least one interim data display page includes a data display page selected from the group consisting of: a data display page showing a low battery indicator, a data display page showing a low memory indicator, and a data display page showing a sync-in-progress indicator.

[0330] Implementation 45. The apparatus of implementation 42, wherein the at least one interim data display page includes a data display page showing user achievement indicator that indicates that one or more quantities based on data provided by the one or more biometric sensors have exceeded a pre-defined threshold, the user achievement indicator in addition to displaying the one or more quantities.

[0331] Implementation 46. The apparatus of implementation 42, further including a communications interface configured to communicate with a device external to the apparatus, wherein: the memory, the at least one processor, the one or more biometric sensors, the display, and the communications interface are communicatively connected with one another, and the memory further stores computer-executable instructions for controlling the at least one processor to: receive a message from the device external to the apparatus via the communications interface, and display a data display page on the display indicating at least some content associated with the message as an interim data display page of the at least one interim data page.

[0332] Implementation 47. The apparatus of implementation 46, wherein the message is a text message, tweet, social networking website comment, or email.

[0333] Implementation 48. The apparatus of implementation 46, wherein the message includes data indicating a user achievement indicator that indicates that one or more quantities based on data provided by another one or more biometric sensors external to the apparatus have exceeded a pre-defined threshold.

[0334] Implementation 49. The apparatus of implementation 41, wherein the plurality of data display pages includes a first subset of at least one data display page, and the memory further stores computer-executable instructions for controlling the at least one processor to cause the at least one data display page of the first subset to be displayed on the display after the display is turned on again regardless of whether the data display page that was displayed on the display when the display was turned off is in the first subset.

[0335] Implementation 50. The apparatus of implementation 28, wherein at least one of the data display pages in the plurality of data display pages has a plurality of data display subpages, and the memory further stores computer-executable instructions for controlling the at least one processor to: determine a sequential subpage display order for the plurality of data display subpages, receive one or more subpage advance requests, and cause, for each received subpage advance request received when the data display subpage having the plurality of data display subpages is displayed, the
